

Radian Pro DX8 Setup

This setup allows full use of the capabilities of the Radian Pro. These settings are provided as a baseline setup only allowing you to build a setup to meet your needs. The values and reverse settings for your model will differ and must be carefully adjusted and tested before flying.

The setup listed has the flaps operate off the flap 3 position switch. The gear switch activates CROW. If the flaps are in the full down position and the gear switch is flipped, the CROW will become active, but only when the flap switch is in the full flap position. The AUX2 switch controls the reflex and camber of the wing.
